

Veeam

Backup, recovery, and data protection

Overview

Veeam is a leading data protection platform for virtual, physical, cloud, and SaaS workloads. Massive IT designs, deploys, and monitors Veeam backups so customers can recover quickly from failures, mistakes, and ransomware.

What we deploy and support

- Veeam Backup & Replication — backup and replication for virtual and physical servers
- Veeam Backup for Microsoft 365 — protection for Exchange, SharePoint, OneDrive, and Teams data
- Immutable backups — backup copies that can't be altered or deleted by ransomware
- Cloud backup and DR — offsite copies and recovery options in the cloud

When customers call us

- Backups that are never tested — and fail when needed
- Ransomware that targets backup files
- No protection for Microsoft 365 data
- Recovery times that are far too long for the business

How Massive IT works with Veeam

Massive IT designs backup strategies around the 3-2-1 rule, deploys and configures Veeam, monitors every job, and performs restore testing so recovery is proven, not assumed.

Veeam fits organizations of all sizes, from a few servers to large virtualized environments.
