

LastPass

Business password management and MFA

Overview

Weak and reused passwords remain a leading cause of breaches. LastPass Business gives employees a secure vault for credentials with admin policies and shared folders. Massive IT deploys and manages LastPass for customer teams.

What we deploy and support

- Password vault — encrypted storage for credentials, notes, and secure data
- Shared folders — controlled credential sharing between teams
- Admin policies and reporting — password policies, security dashboards, and user management
- Multifactor authentication — an additional layer of sign-in protection

When customers call us

- Passwords reused across accounts or stored in spreadsheets
- Shared logins with no control over who has access
- Offboarding that leaves former staff with saved credentials
- Compliance requirements for credential management

How Massive IT works with LastPass

Massive IT rolls out LastPass, configures policies and shared folders, trains users, and integrates onboarding and offboarding into our help desk process.

LastPass Business fits small and midsize organizations that need simple, centrally managed password security.
