

ConnectSecure

Continuous vulnerability and attack-surface management

Overview

ConnectSecure provides vulnerability scanning, external attack-surface monitoring, and compliance reporting. Massive IT uses it to continuously identify weaknesses across customer environments and track remediation.

What we deploy and support

- Internal vulnerability scanning — agent and network scans for missing patches and misconfigurations
- External attack-surface scanning — monitoring of internet-facing systems
- Compliance assessments — reporting mapped to common frameworks
- Remediation planning — prioritized fix lists and progress tracking

When customers call us

- No clear picture of which systems are vulnerable
- Exposed services on the internet nobody knew about
- Compliance and insurance questionnaires asking for scan evidence
- Patching without a way to verify coverage

How Massive IT works with ConnectSecure

Massive IT deploys ConnectSecure, schedules continuous scans, prioritizes findings, and works remediation through our managed services, with reports customers can share with auditors and insurers.

ConnectSecure fits organizations of any size that need ongoing vulnerability visibility and compliance readiness evidence.
