

Aeris

Cellular IoT connectivity and device management

Overview

Aeris provides cellular IoT connectivity, SIM management, and IoT security. Massive IT helps customers connect devices and sites over cellular — for failover, remote locations, and IoT deployments.

What we deploy and support

- Cellular IoT connectivity — multi-network connectivity for devices and remote sites
- SIM and device management — provisioning, monitoring, and control of connected SIMs
- IoT security — visibility and threat detection for connected devices
- Cellular failover — backup connectivity when primary internet goes down

When customers call us

- Sites that go offline whenever the primary internet circuit fails
- Remote or temporary locations without wired internet
- Fleets of connected devices that are hard to track and secure
- Managing data plans across many devices

How Massive IT works with Aeris

Massive IT designs cellular connectivity into network and IoT projects, provisions SIMs, integrates failover with firewalls and routers, and monitors usage.

Aeris fits organizations with remote sites, IoT devices, or a need for resilient backup connectivity.
